About AMAZALERT

AMAZALERT examines how global and regional climate and land-use changes will impact Amazonian forests, agriculture, waters, and people; and how these impacts feed back onto climate.

English | Portuguese

Welcome to the AMAZALERT project website

AMAZALERT enables raising the alert about critical feedbacks between climate, society, land-use change, vegetation change, water availability and policies in Amazonia.

This programme will:

1. analyze and improve coupled models of global climate and Amazon, land use, vegetation and socio-economic drivers to quantify anthropogenic and climate induced land-use and land cover change and non-linear, irreversible feedbacks among these components
2. assess the role of regional and global policies and societal responses in the Amazon region for altering the trajectory of land-use change in the face of climate change and other anthropogenic factors and finally
3. propose i) an Early Warning System for detecting any imminent irreversible loss of Amazon ecosystem services, ii) policy response strategies to prevent such loss.
